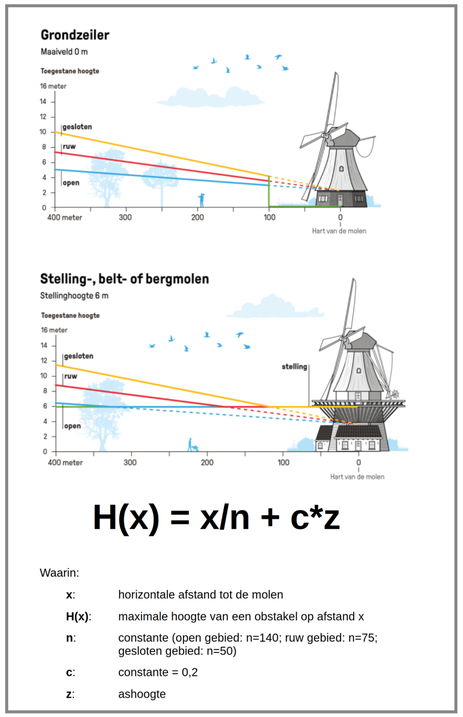
Windmill Biotopes

Windmills need to catch enough wind to run. Tall buildings and trees prevent the wind to fully hit the mill. Municipal policies should prevent constructing tall buildings near windmills.



$$H(x) = x/n + c*z$$

Waarin:

- **x**: horizontale afstand tot de molen
- **H(x)**: maximale hoogte van een obstakel op afstand x
- **n**: constante (open gebied: n=140; ruw gebied: n=75; gesloten gebied: n=50)
- **c**: constante = 0,2
- **z**: ashoogte

The biotope formula and example profile.

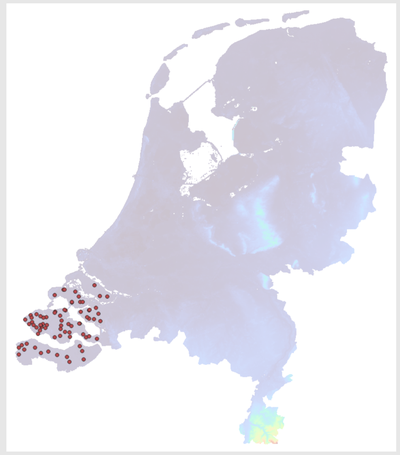
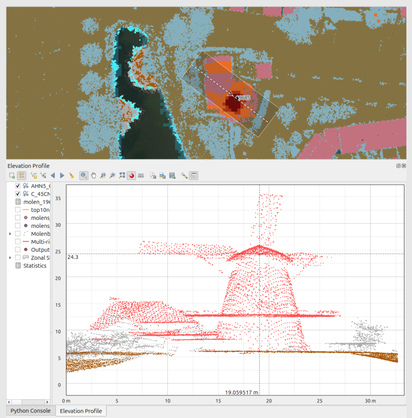
OPEN GEO GROEP

Provincie Zeeland

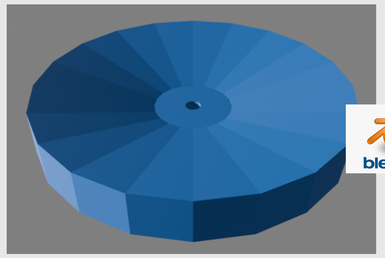
Input



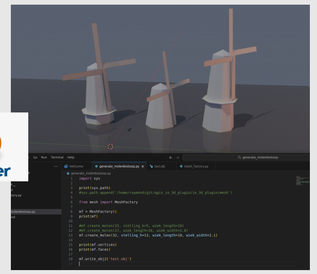
Windmill locations in Zeeland and the Digital Surface Model (AHN) 50cm resolution.



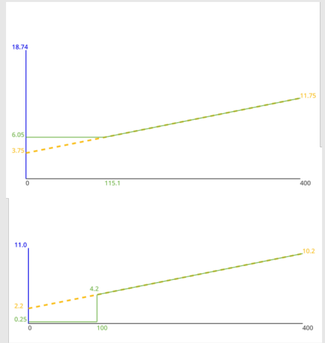
Capturing specific windmill features using point cloud data.



Windmill biotopes as .obj meshes.

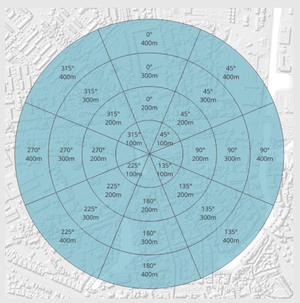


Windmill meshes generated by parameters.



Biotope profiles (svg)

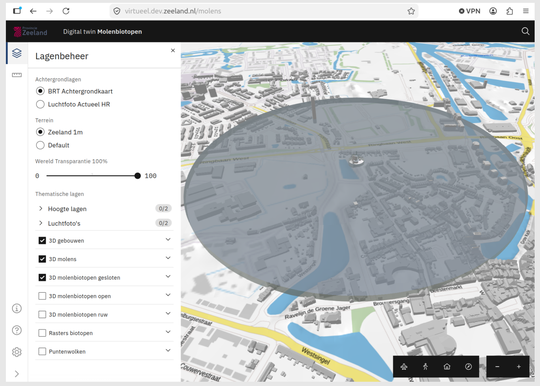
Windmill biotopes as .tiff raster.



Sectors

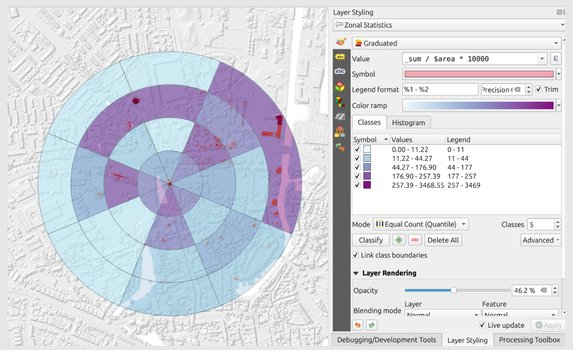
Raster analyses: difference between DSM and biotope.

Products



3D Viewer showing windmill biotopes, windmills and buildings.

CESIUM Part of Bentley Systems



Maps per windmill, showing state per sector and exceeding areas.
